Immersive Challenge

Now that you have some Laravel MVC skills, under your belt your next task is to create a Forum for the young start-up called MEAT LABS Inc.
The client is not expecting all the features to be completed, therefore he does not want a fancy looking forum but doesn't mind if it does. For now he simply wants the core functionality working correctly.

The core functionality for the forum is as follows:
- Users can log in with email and password or register,
- When a new user is registering for the site, the basic information that is collected as follows
    - First Name
    - Last Name
    - Email
    - Password
    - Username
- Upon successful account creation an email will get sent out to the user thanking them for registering.
- Upon user login, a user lands on the main forum page and sees all the posts.
- User may edit their biography and user name only.
- A user can create new posts, edit his posts and comment on his or other posts.
- A user can only remove his post or his comment.
- Admins can remove any post, deletion of posts should also delete the comments associated with the post.
- Admins can assign user roles as remove them - note admins can not remove their admin role.
- Admins can delete any user account - doing so should inform the user via email that their account has been marked for deletion.

You can use all of the resources provided including the instructor for this project.
Code should be tracked with git using GitHub as the server.
